

The NOvA Experiment

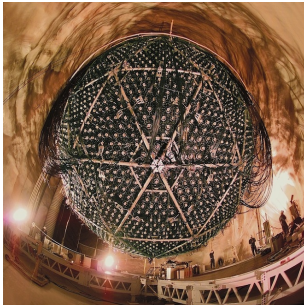

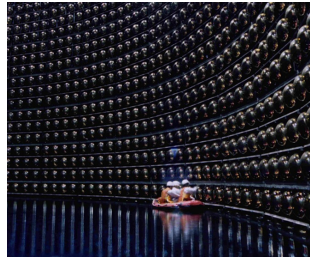

Users Meeting 2017

Kanika Sachdev

June 08, 2017

- * Neutrino oscillation are a firmly established Beyond Standard Model phenomenon

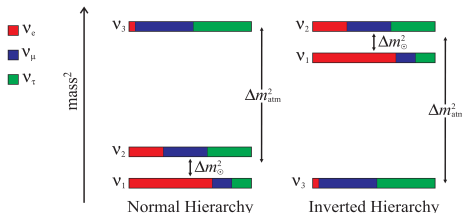

- * Hierarchy of neutrino mass states :

Normal or Inverted?

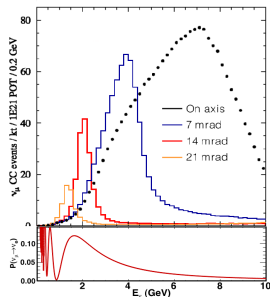

- * Flavor content of ν_3 : is θ_{23} maximal ie $\pi/4$?

- * Is CP violated by neutrinos: do neutrinos and anti-neutrinos oscillate differently?

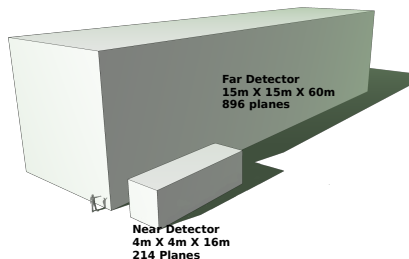

The NOvA Experiment

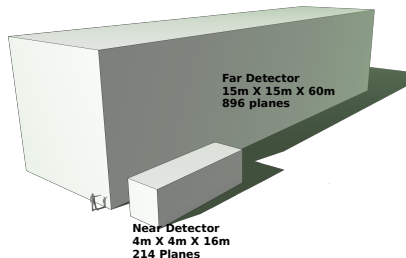

- * NOvA (NuMI Off-axis ν_e Appearance) is a neutrino oscillation experiment
 - * Baseline of 810 km
 - * NuMI, beam of mostly ν_μ
 - * 14 mrad off-axis from the beam

- * NOvA (NuMI Off-axis ν_e Appearance) is a neutrino oscillation experiment
 - * Baseline of 810 km
 - * NuMI, beam of mostly ν_μ
 - * 14 mrad off-axis from the beam
 - * Two functionally identical detectors

- * NOvA (NuMI Off-axis ν_e Appearance) is a neutrino oscillation experiment
 - * Baseline of 810 km
 - * NuMI, beam of mostly ν_μ
 - * 14 mrad off-axis from the beam
 - * Two functionally identical detectors
- * Oscillation channels accessible to NOvA:
 - * $\nu_\mu(\bar{\nu}_\mu)$ to $\nu_\mu(\bar{\nu}_\mu)$ (disappearance)
 - * $\nu_\mu(\bar{\nu}_\mu)$ to $\nu_e(\bar{\nu}_e)$ (appearance)

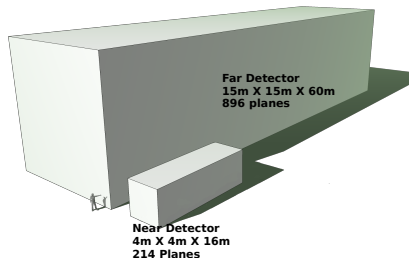

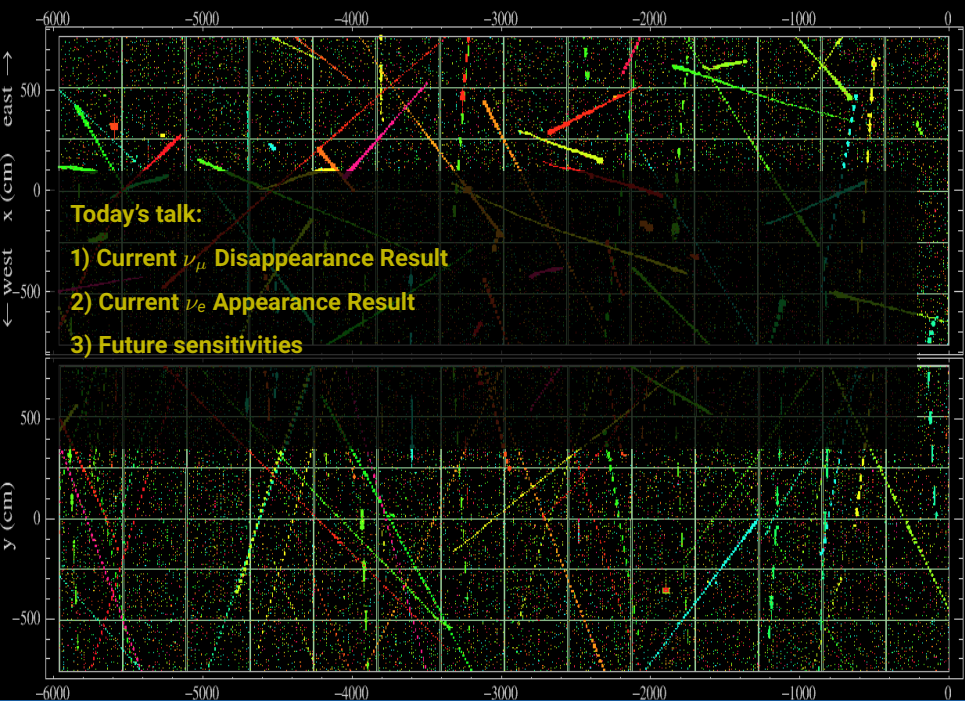

- * NOvA (NuMI Off-axis ν_e Appearance) is a neutrino oscillation experiment

- * Baseline of 810 km
- * NuMI, beam of mostly ν_μ
- * 14 mrad off-axis from the beam
- * Two functionally identical detectors

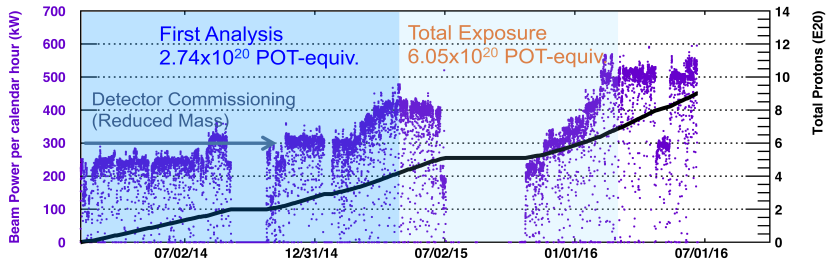

- * Oscillation channels accessible to NOvA:

- * $\nu_\mu(\bar{\nu}_\mu)$ to $\nu_\mu(\bar{\nu}_\mu)$ (disappearance)
- * $\nu_\mu(\bar{\nu}_\mu)$ to $\nu_e(\bar{\nu}_e)$ (appearance)
- * Sterile neutrino search
- * Cross-section measurements, supernovae, search for BSM phenomena etc

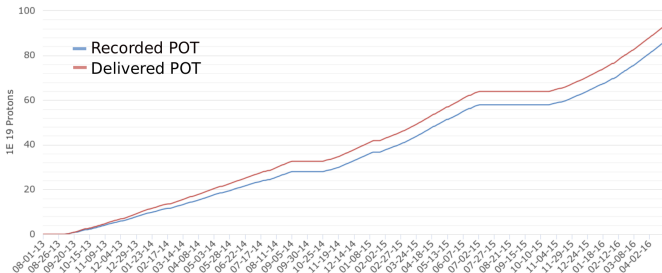

- * Full detector equivalent exposure: 6.05×10^{20} POT
- * More than double the exposure of the 2015 analyses
- * Excellent beam!

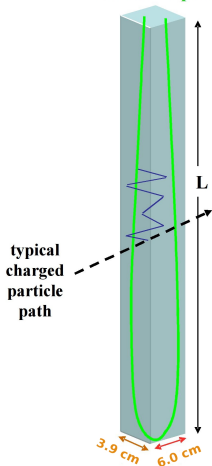

- * Hit 700 kW earlier this year, running routinely around 650 kW these days
- * Currently running in anti-neutrino mode, since February 2017

- * Full detector equivalent exposure: 6.05×10^{20} POT
- * More than double the exposure of the 2015 analyses
- * Excellent beam!

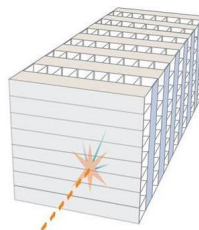

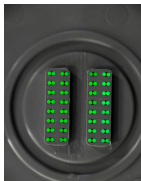

- * FD has recorded 93% of the delivered POT over all time
- * Currently operating at 98% efficiency

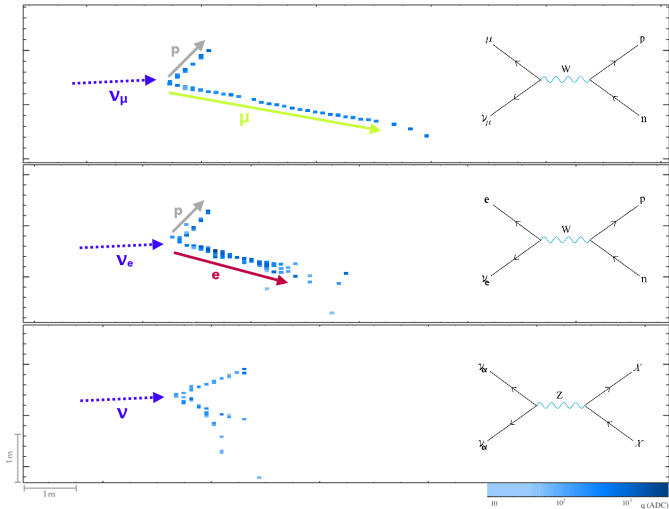

To 1 APD pixel

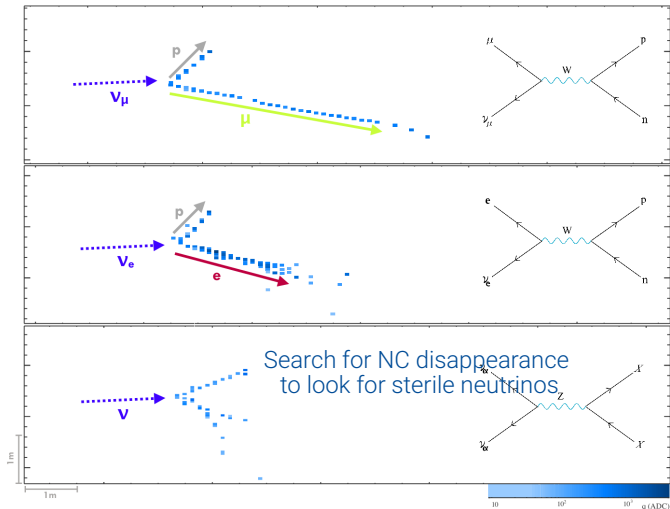

- * Composed of PVC modules extruded to form long tube-like cells : 15 m long in FD, 4 m ND
- * Each cell is filled with liquid scintillator
- * Optical fiber loop carries scintillation light to a pixel on an Avalanche Photo Diode (APD)
- * Cells arranged in planes, with alternating planes perpendicular in orientation
- * Detectors are 65% active

- * Low-Z material, each plane samples ~ 0.18 radiation-lengths
- * Molière radius is ~ 10 cm, 2.5 NOvA cells

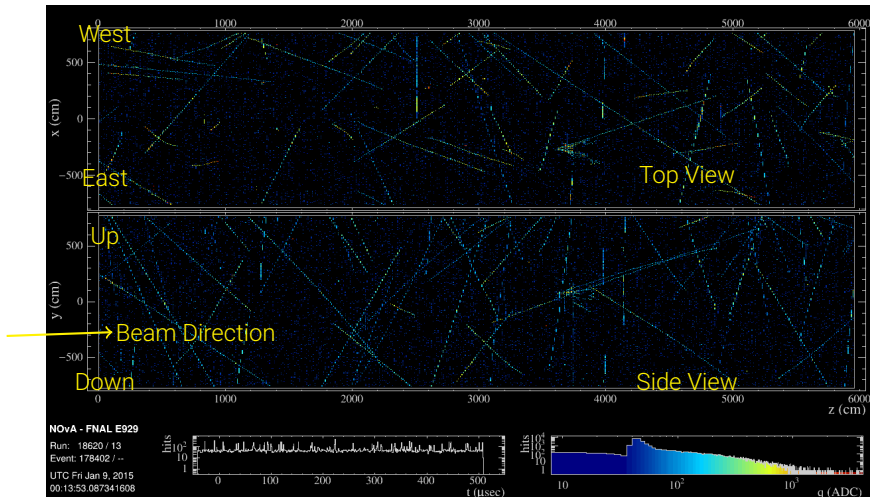

- * Low-Z material, each plane samples ~ 0.18 radiation-lengths
- * Molière radius is ~ 10 cm, 2.5 NOvA cells

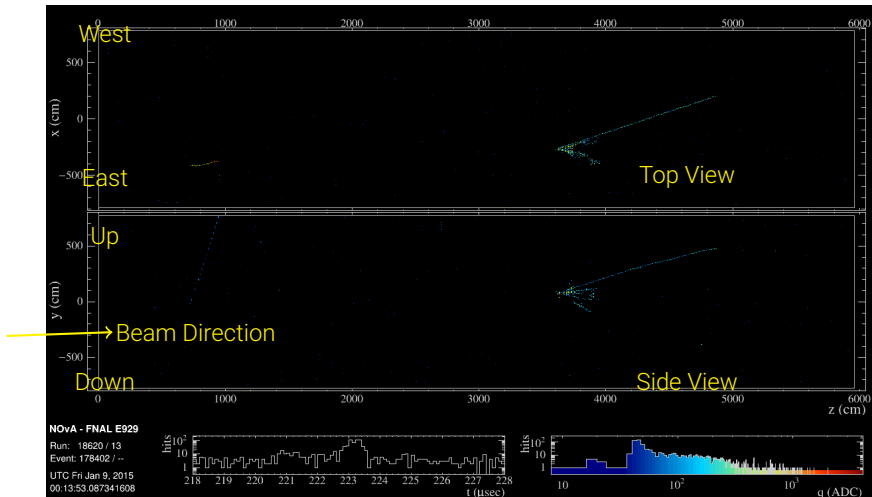

Far Detector Data

- * FD is on the surface, 14 kT mass and has $> 344,000$ channels
- * Trigger window is $500 \mu\text{s}$, neutrino spill only lasts $10 \mu\text{s}$

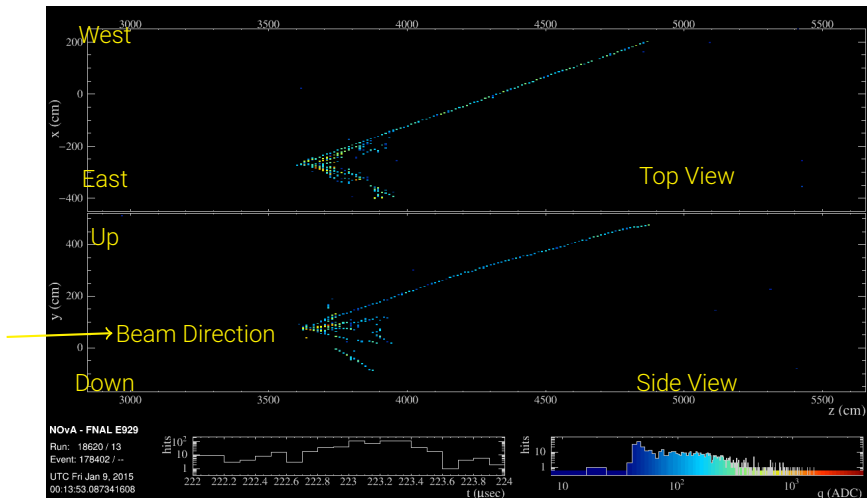

Far Detector Data

- * FD is on the surface, 14 kT mass and has $> 344,000$ channels
- * Trigger window is $500 \mu\text{s}$, neutrino spill only lasts $10 \mu\text{s}$

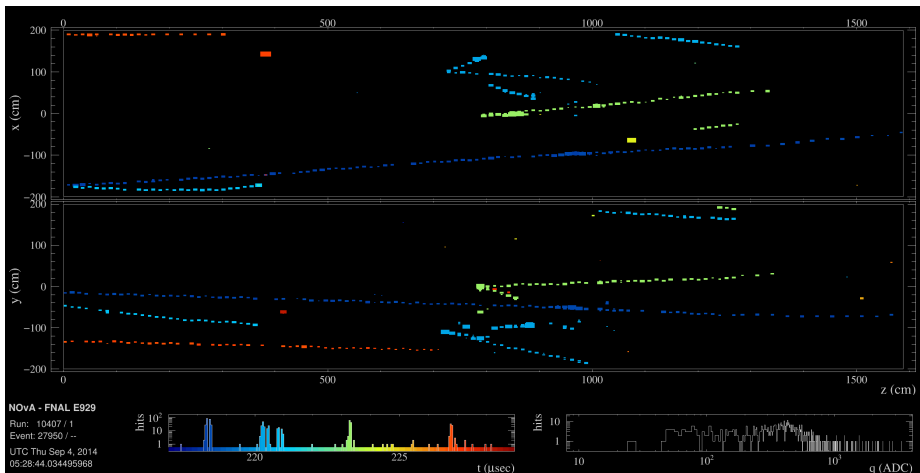

- * FD is on the surface, 14 kT mass and has $> 344,000$ channels
- * Trigger window is $500 \mu\text{s}$, neutrino spill only lasts $10 \mu\text{s}$

Near Detector Data

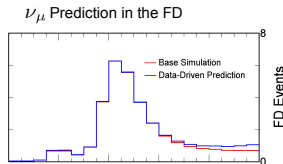

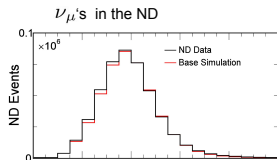

- * ND is 100 m underground
- * Has 0.3 kT mass and $> 20,000$ channels

Oscillation Analyses

Two Detector Technique

- * We use ND data to predict the oscillated spectra in the FD
- * Both disappearance ($\nu_\mu \rightarrow \nu_\mu$) and appearance ($\nu_\mu \rightarrow \nu_e$) analyses start with ν_μ 's in ND

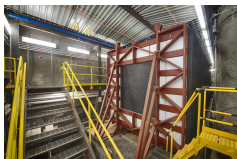

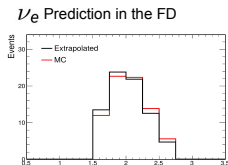

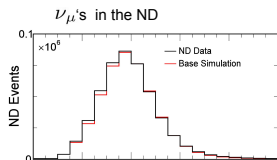

$$F/N \times P(\nu_\mu \rightarrow \nu_\mu)$$

Two Detector Technique

- * We use ND data to predict the oscillated spectra in the FD
- * Both disappearance ($\nu_\mu \rightarrow \nu_\mu$) and appearance ($\nu_\mu \rightarrow \nu_e$) analyses start with ν_μ 's in ND

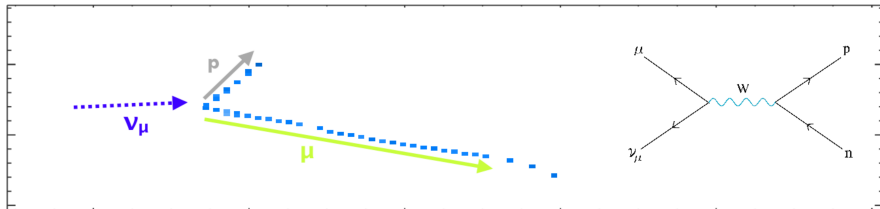

$$F/N \times P(\nu_\mu \rightarrow \nu_e)$$

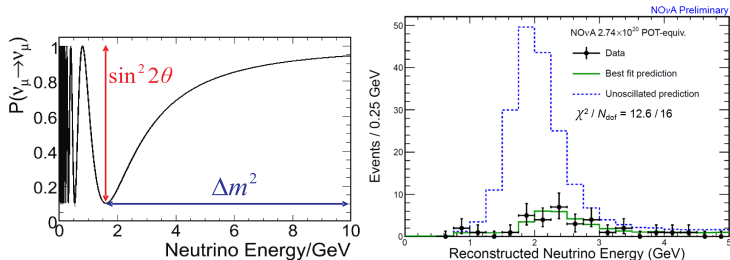

ν_μ Disappearance Analysis

ν_μ Disappearance

- * Requires identification of ν_μ

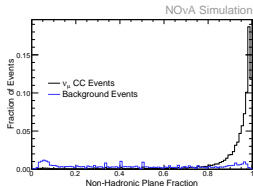

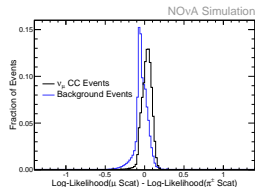

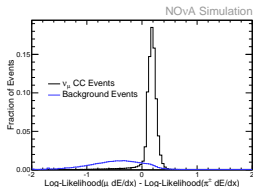

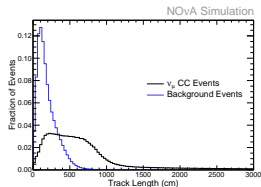

- * Requires energy reconstruction

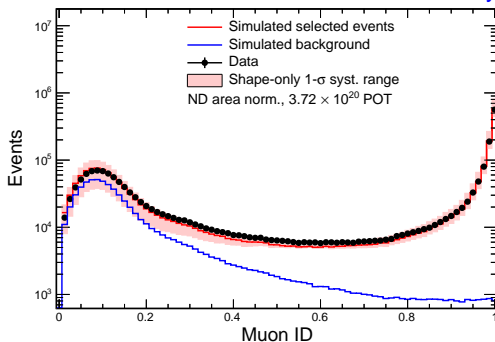

Selection of ν_μ CC

Combine input variables in a k-Nearest Neighbor algorithm
 ν_μ selection purity of **95%** and efficiency of **81%**

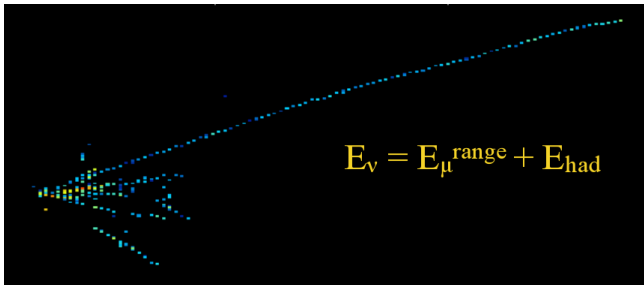

Combine input variables in a k-Nearest Neighbor algorithm
 ν_μ selection purity of **95%** and efficiency of **81%**

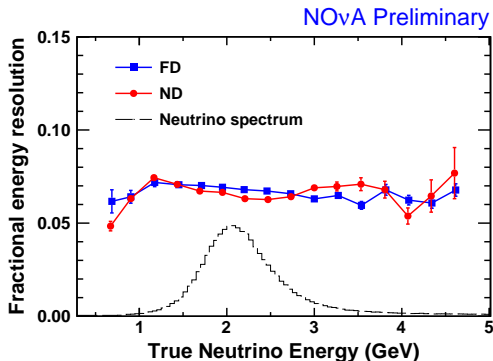

NOvA Preliminary

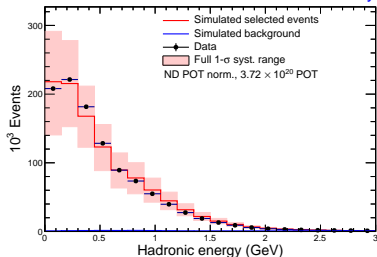

- * Muon energy reconstructed from range with resolution $\sim 3\%$
- * Hadronic system: $\sum_{cell} E_{visible} \implies E_{had}$, resolution $\sim 20\%$
- * Neutrino energy is the sum of the two
- * Energy resolution $\sim 7\%$ at beam peak

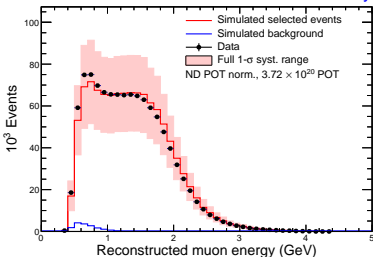

- * Muon energy reconstructed from range with resolution $\sim 3\%$
- * Hadronic system: $\sum_{\text{cell}} E_{\text{visible}} \implies E_{\text{had}}$, resolution $\sim 20\%$
- * Neutrino energy is the sum of the two
- * Energy resolution $\sim 7\%$ at beam peak

NOvA Preliminary

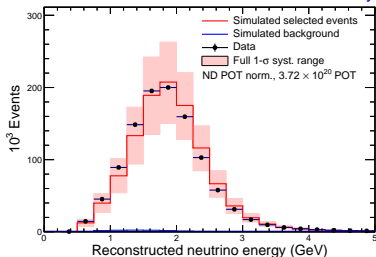

NOvA Preliminary

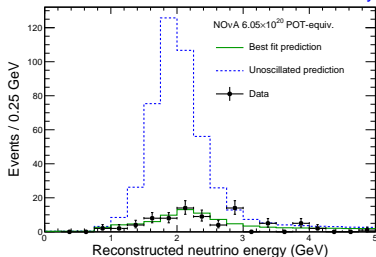

- * Performance in the ND shows good data-MC agreement after simulation tuned to include nucleon-correlation effects, with input from our data and Minerva

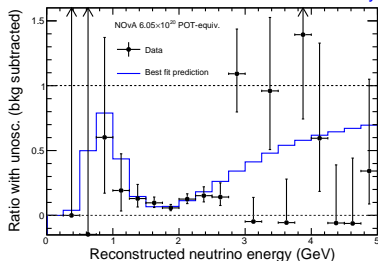

NOvA Preliminary

NOvA Preliminary

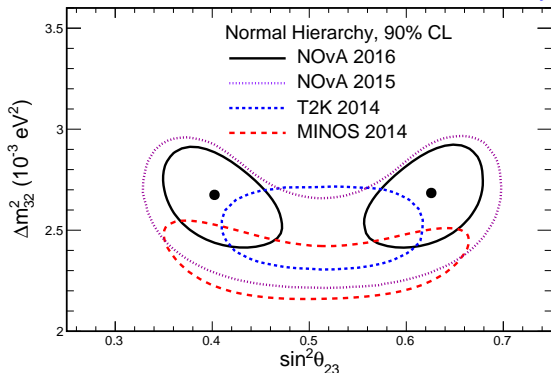

NOvA Preliminary

- * Expected 473 events, observe 78 events
- * Estimated background of 3.7 events from beam and 2.9 from cosmics
- * Fit for Δm_{32}^2 and $\sin^2 \theta_{23}$

NOvA Preliminary

* Best fit at 68% CL

(NH):

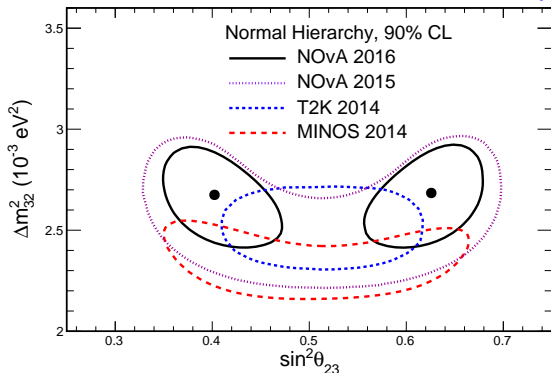

$$\Delta m_{32}^2 = (2.67 \pm 0.11) \times 10^{-3} \text{ eV}^2$$

$$\sin^2 \theta_{23} = 0.404^{+0.030}_{-0.022}$$

$$\text{or } 0.624^{+0.022}_{-0.030}$$

* Fit $\chi^2 = 41.6/17$ * Rejection of maximal mixing at 2.6σ

NOvA Preliminary

* Best fit at 68% CL

(NH):

$$\Delta m_{32}^2 = (2.67 \pm 0.11) \times 10^{-3} \text{ eV}^2$$

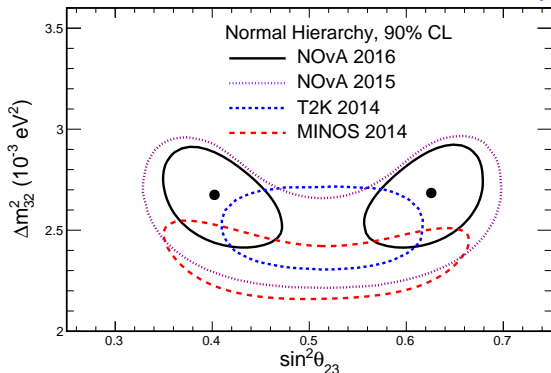

$$\sin^2 \theta_{23} = 0.404^{+0.030}_{-0.022}$$

$$\text{or } 0.624^{+0.022}_{-0.030}$$

* Fit $\chi^2 = 41.6/17$ * Rejection of maximal mixing at 2.6σ

* Phys. Rev. Lett. 118, 151802 – Published 10 April 2017- Editors' Suggestion!

NOvA Preliminary

* Best fit at 68% CL

(NH):

$$\Delta m_{32}^2 = (2.67 \pm 0.11) \times 10^{-3} \text{ eV}^2$$

$$\sin^2 \theta_{23} = 0.404^{+0.030}_{-0.022}$$

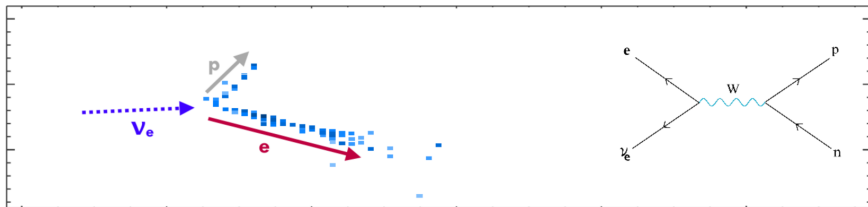

$$\text{or } 0.624^{+0.022}_{-0.030}$$

* Fit $\chi^2 = 41.6/17$ * Rejection of maximal mixing at 2.6σ

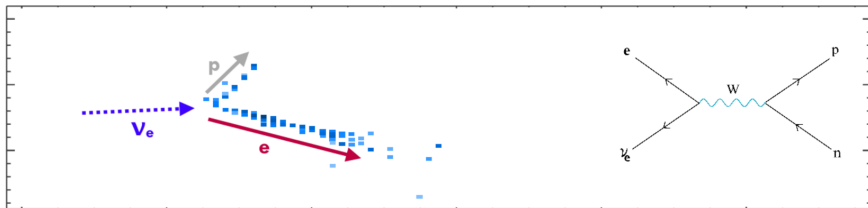

* Phys. Rev. Lett. 118, 151802 – Published 10 April 2017- Editors' Suggestion!

* Higher statistic analysis with 50% more POT coming by Fall 2017

ν_e Appearance Analysis

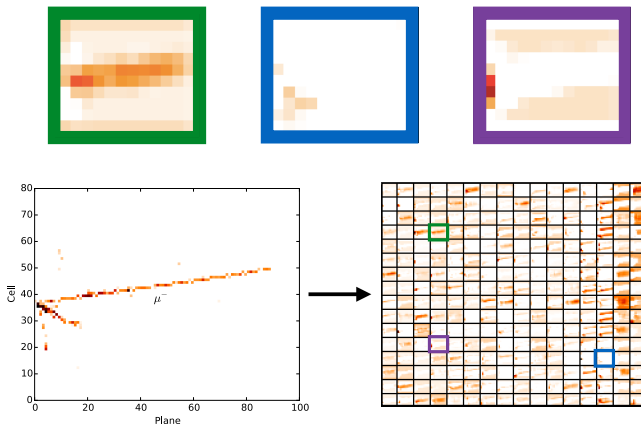

- * Leading order term in $P(\nu_\mu \rightarrow \nu_e) \propto \sin^2 \theta_{23}$
- * Other terms depend on δ_{CP} and mass hierarchy
- * Cause enhancement or suppression in $P(\nu_\mu \rightarrow \nu_e)$ as large as 30%
- * Hierarchy and CP have the opposite effects on ν and $\bar{\nu}$

- * Use ν_μ CC in ND to estimate ν_e appearance signal in FD
- * Use ν_e PID in ND to estimate backgrounds (NC, beam ν_e CC and ν_μ CC)
- * Extrapolate backgrounds to the FD for a complete prediction
- * Fit the ν_e appearance spectrum to extract oscillation parameters

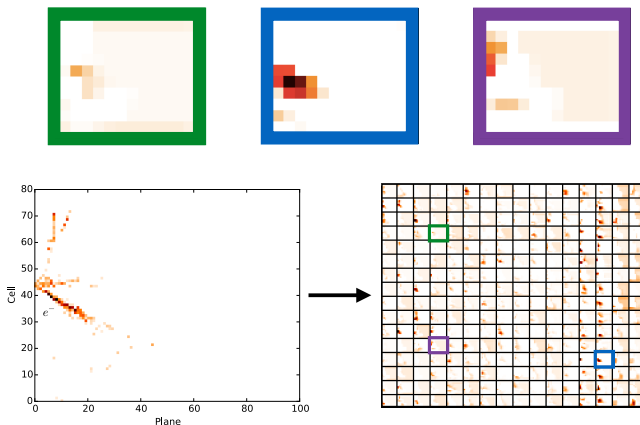

Identifying Electron Neutrinos: CVN

- * CVN: Convolutional Visual Network, a deep neural network
- * Input is the NOvA event display (pixel map)
- * Each layer perform convolutions to extract abstract features

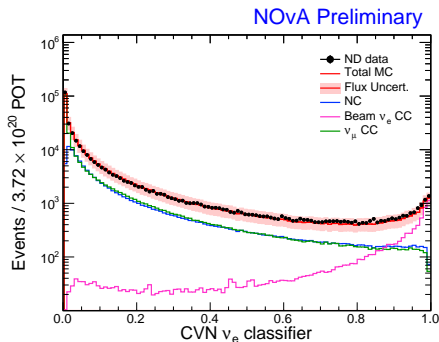

Identifying Electron Neutrinos: CVN

- * CVN: Convolutional Visual Network, a deep neural network
- * Input is the NOvA event display (pixel map)
- * Each layer perform convolutions to extract abstract features

Performance of CVN

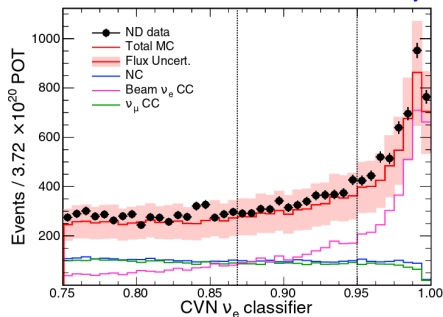

- * Select ν_e CC interactions with 73% efficiency and 76% purity
- * Most left over backgrounds have an energetic EM shower in them
- * Equivalent to 30% increase in exposure compared to more conventional PIDs
- * Presents good data-MC agreement in ND

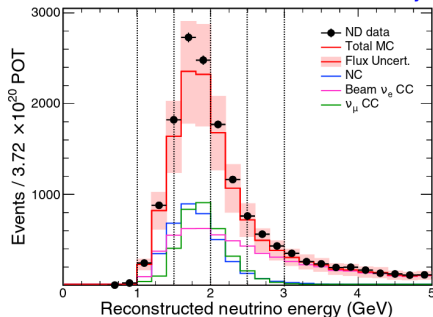

Performance of CVN

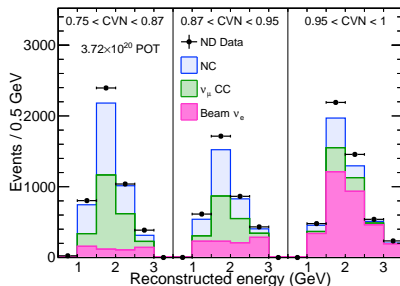

- * Select ν_e CC interactions with 73% efficiency and 76% purity
- * Most left over backgrounds have an energetic EM shower in them
- * Equivalent to 30% increase in exposure compared to more conventional PIDs
- * Presents good data-MC agreement in ND
- * Analysis done in 4 energy bins in each of 3 PID bins

NOvA Preliminary

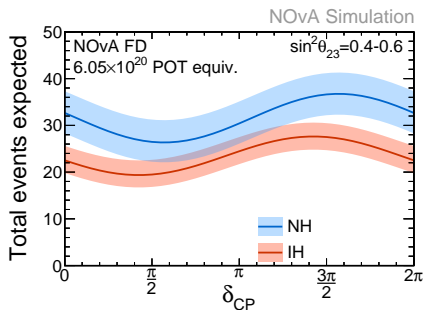

NOvA Preliminary

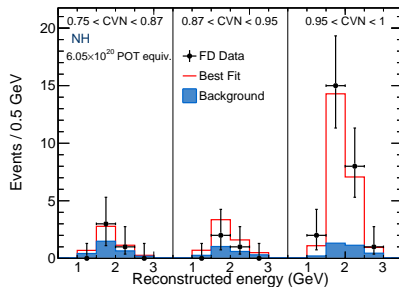

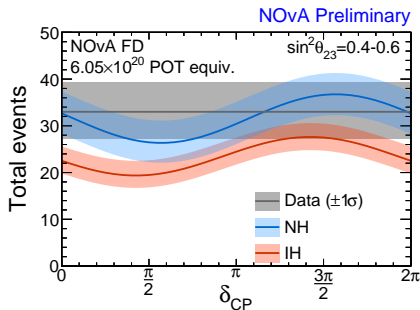

- * ν_e CC selection selects 10% more events in ND data than in simulation
- * Use data driven methods to estimate what fraction in data is NC, beam ν_e CC and ν_μ CC
- * Extrapolate these adjustments to the FD for more realistic background estimates

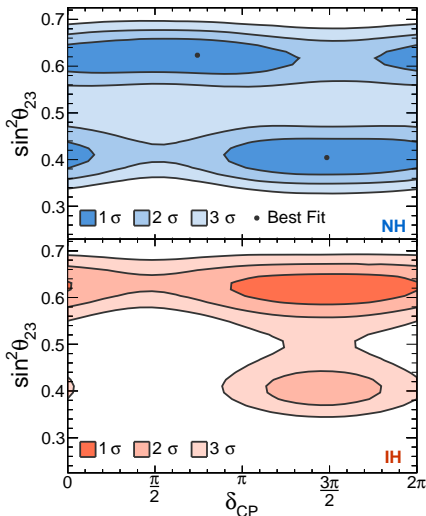

Background	Estimate
Total Bg	8.2
NC	3.7
Beam ν_e CC	3.1
ν_μ CC	0.7
ν_τ CC	0.1
Cosmic	0.5

Expect ~ 19 and ~ 36 events in total, in two most extreme oscillation scenarios (at maximal mixing)

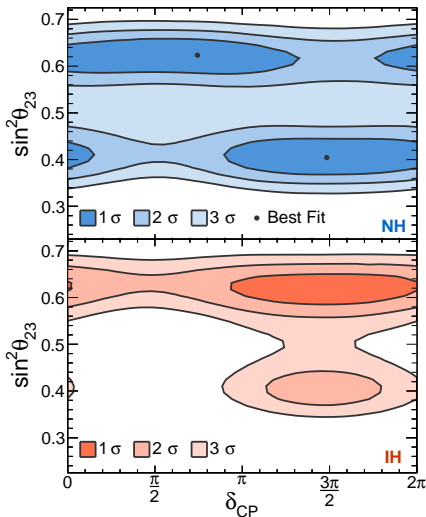

Final Prediction in FD

Observe 33 events
 $> 8\sigma$ significance of ν_e appearance

ν_e Fit Result

- * Joint fit of ν_e appearance data and ν_μ disappearance data from NOvA
- * Constrain $\sin^2 2\theta_{13} = 0.085 \pm 0.005$, reactor average value
- * Systematics included as nuisance parameters and correlated properly between ν_μ and ν_e in the fit
- * Contours include Feldman-Cousins corrections

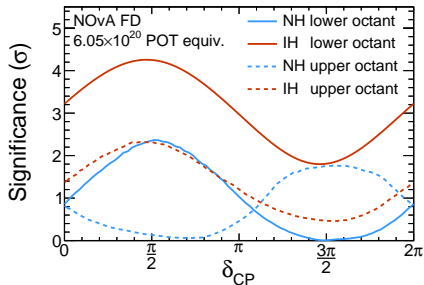

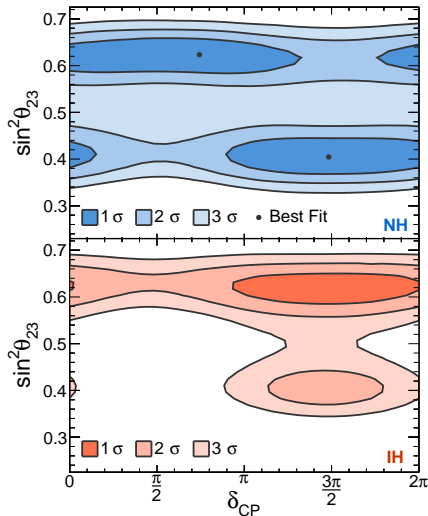

- * Two statistically degenerate best fit points are in Normal Hierarchy

$$\sin^2 \theta_{23} = 0.404, \delta_{CP} = 1.48\pi, \text{ and}$$

$$\sin^2 \theta_{23} = 0.623, \delta_{CP} = 0.74\pi$$

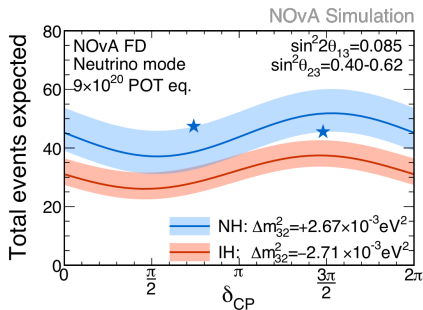

- * The best-fit point in the Inverted Hierarchy near $\delta_{CP} = 3\pi/2$, 0.46σ from the global best-fit points

ν_e Fit Result

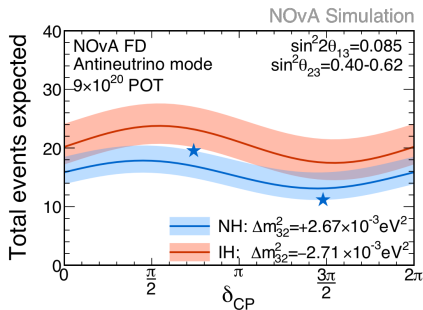

- * Inverted Mass Hierarchy in the lower θ_{23} octant disfavored at $> 93\%$ C.L. for all values of δ_{CP}
- * Phys. Rev. Lett. 118, 231801 : Editors' Suggestion!

Future

- * Hierarchy and CP have opposite effects on anti-neutrinos
- * NuMI switched to anti-neutrino mode in February 2017
- * Plan to collect ν and $\bar{\nu}$ data in 50-50 ratio
- * Will help resolve some of the degeneracies

- * Hierarchy and CP have opposite effects on anti-neutrinos
- * NuMI switched to anti-neutrino mode in February 2017
- * Plan to collect ν and $\bar{\nu}$ data in 50-50 ratio
- * Will help resolve some of the degeneracies

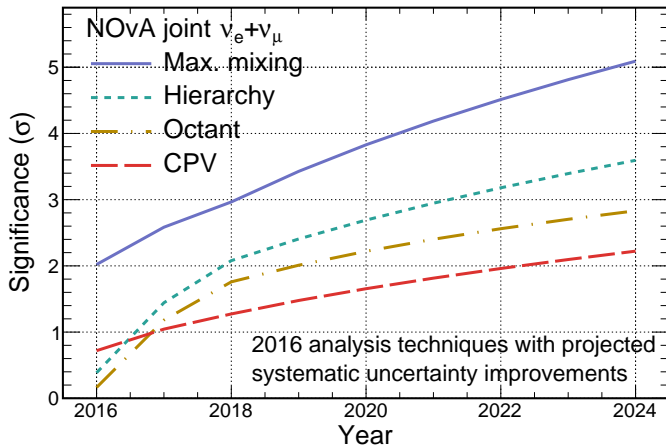

Future Sensitivity Projections

Projected significance of rejecting maximal mixing, wrong hierarchy, wrong octant and CP conservation

Normal $\delta_{CP}=3\pi/2$, $\sin^2\theta_{23}=0.403$

$\Delta m_{32}^2=2.5\times 10^{-3}\text{eV}^2$, $\sin^2\theta_{13}=0.022$

NOvA Simulation

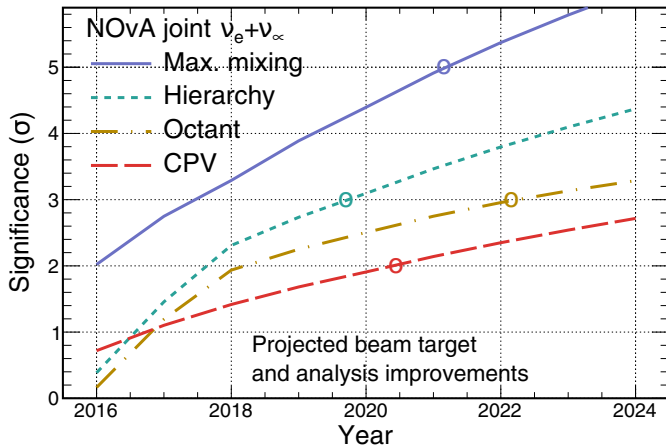

- * Improvements in **suppressing systematics**
- * 25% gain in exposure from **improved analysis**
- * **40 weeks of beam** starting 2018
- * **PIP 1+:** 800 kW in 2019, 900 kW in 2021 + target improvements

Future Sensitivity Projections

Projected significance of rejecting maximal mixing, wrong hierarchy, wrong octant and CP conservation

Normal $\delta_{CP}=3\pi/2$, $\sin^2\theta_{23}=0.403$
 $\Delta m_{32}^2=2.5 \cdot 10^{-3} \text{eV}^2$, $\sin^2\theta_{13}=0.022$

NOvA Simulation

- * Improvements in **suppressing systematics**
- * 25% gain in exposure from **improved analysis**
- * **40 weeks of beam** starting 2018
- * **PIP 1+:** 800 kW in 2019, 900 kW in 2021 + target improvements

- * NOvA has analyzed 6.05×10^{20} POT worth of neutrino data
- * The measurement of ν_μ disappearance at NOvA is **non-maximal at 2.6σ**
- * A combined fit of appearance and disappearance channels **rejects Inverted Hierarchy with lower θ_{23} octant for all values of δ_{CP} at $> 93\%$ CL**
- * Here's what's coming soon:
 - * Higher stats analysis of ν_μ **disappearance this Fall, improved precision of θ_{23} measurement**
 - * Currently running in anti-neutrinos, should help break the degeneracy between upper and lower octant
 - * **Combined $\nu - \bar{\nu}$ result scheduled for Summer 2018!**

- * With improvements across **analysis, detector operation and beam** we have an opportunity to hit **major milestones** in neutrino physics before 2024
- * **5σ** rejection of **maximal mixing**
- * **3σ** mass **hierarchy** determination
- * **3σ** **octant** determination
- * **2σ** sensitivity to **CP violation**

Thank you!

NOvA Posters at Users' Meeting 2017:

1. The **Physics Program** of NOvA - Alex Radovic and Gavin Davies
2. **Three-Flavor Oscillations** in NOvA - Erika Cantano-Mur and Kirk Bays
3. **Sterile neutrino** search through Neutral Current Disappearance in NOvA experiment - Shaokai Yang

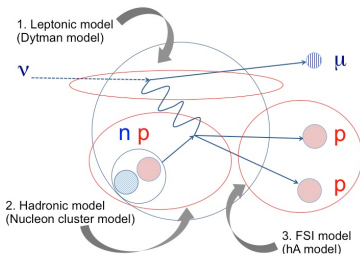

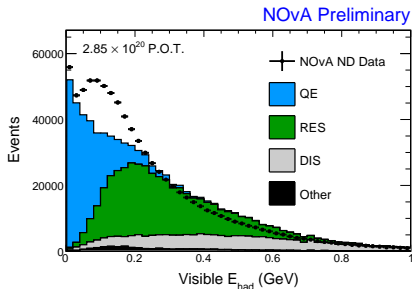

Backup

Scattering in a Nuclear Medium

- * The hadronic energy spectrum in ND Data suggests missing interaction mode in simulation
- * Supported by observations by Minerva experiment ^a
- * Use GENIE's Meson Exchange Current to model these interactions of neutrinos scattering off correlated pair of nucleons ^b

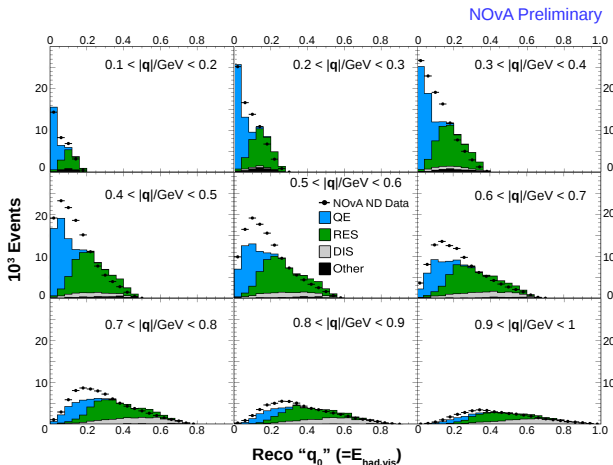

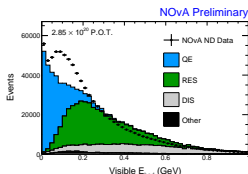

^aP.A. Rodrigues et al. (MINERvA Collaboration) Phys. Rev. Lett. 116, 071802

^bS. Dytman, based on J. W. Lightbody, J. S. OConnell, Comp. in Phys. 2 (1988) 57

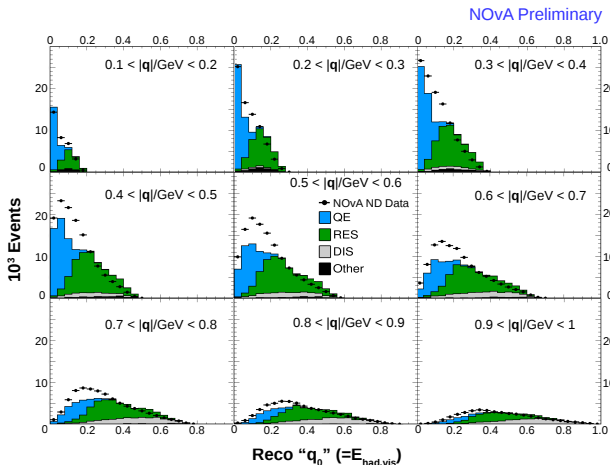

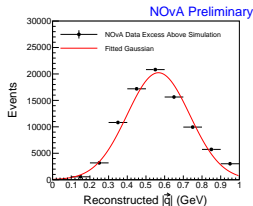

Scattering in a Nuclear Medium

- * Tuned the default MEC model by fitting the data excess in bins of hadronic energy and momentum transfer

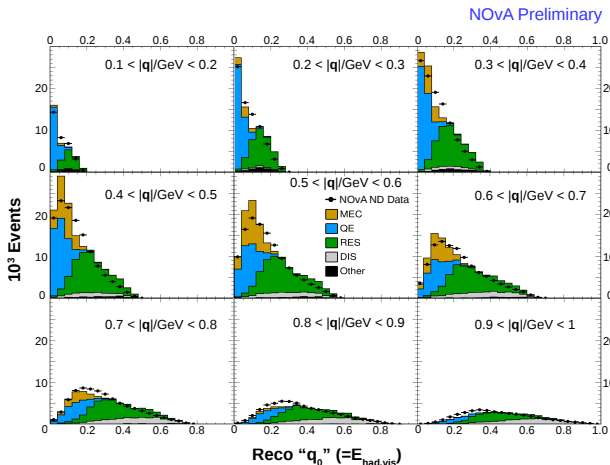

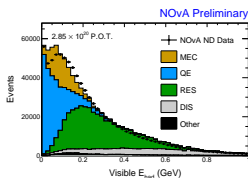

Scattering in a Nuclear Medium

- * Tuned the default MEC model by fitting the data excess in bins of hadronic energy and momentum transfer

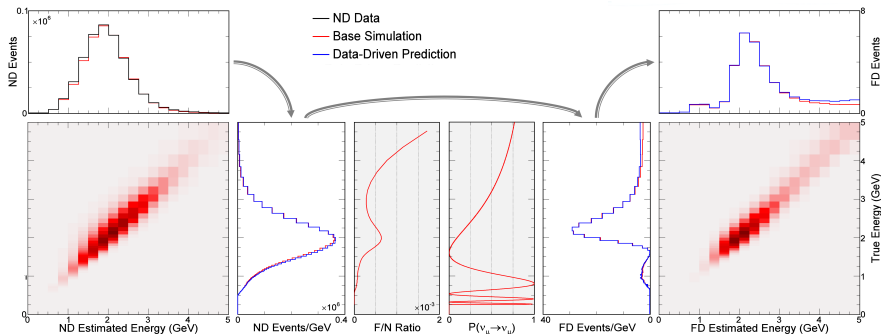

Scattering in a Nuclear Medium

- * Tuned the default MEC model by fitting the data excess in bins of hadronic energy and momentum transfer

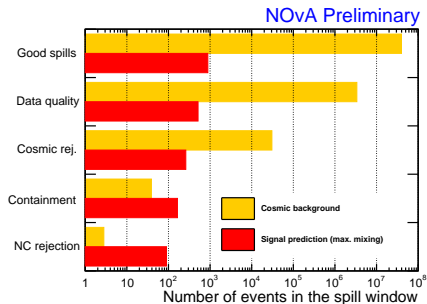

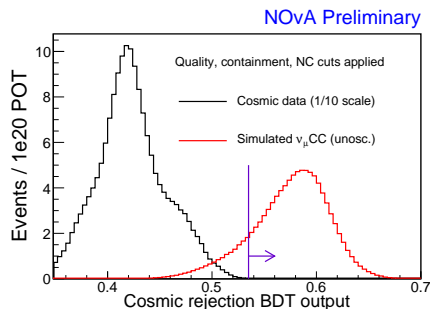

Two Detector Technique

- ✧ To predict oscillated spectra in FD, both, appearance and disappearance analyses start with selecting ν_μ CC interactions in ND
- ✧ The reconstructed ND ν_μ CC energy spectrum is used to correct the FD simulated prediction

Cosmic Rejection

Cosmic rejection BDT based on muon direction, position, length, number of hits in slice and energy

Rejection factor of 10^7 achieved with event topology

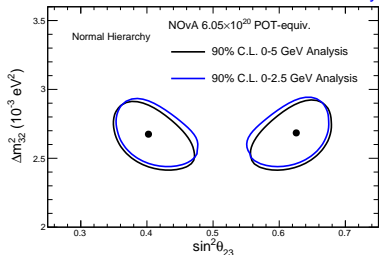

Final background measured directly from beam-off FD data

- * Most systematics are negligible in F/N ratio
- * Including MEC in simulation reduces hadronic energy systematic
- * Systematics included as pull terms in the fit
- * Table quotes increase in 68% contours relative to stat-only fit

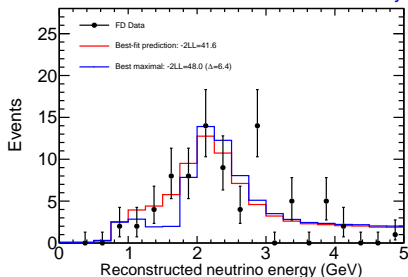

Source of uncertainty	Uncertainty in $\sin^2\theta_{23}(\times 10^{-3})$	Uncertainty in $\Delta m_{32}^2 (\times 10^{-6} \text{ eV}^2)$
Absolute muon energy scale [$\pm 2\%$]	+9 / -8	+3 / -10
Relative muon energy scale [$\pm 2\%$]	+9 / -9	+23 / -14
Absolute hadronic energy scale [$\pm 5\%$]	+5 / -5	+7 / -3
Relative hadronic energy scale [$\pm 5\%$]	+10 / -11	+29 / -19
Normalization [$\pm 5\%$]	+5 / -5	+4 / -8
Cross sections and final state interactions	+3 / -3	+12 / -15
Neutrino flux	+1 / -2	+4 / -7
Beam background normalization [$\pm 100\%$]	+3 / -6	+10 / -16
Scintillation model	+4 / -3	+2 / -5
$\delta_{\text{CP}} [0 - 2\pi]$	+0.2 / -0.3	+10 / -9
Total systematic uncertainty	+17 / -19	+50 / -47
Statistical uncertainty	+21 / -23	+93 / -99

Disappearance Result

NOvA Preliminary

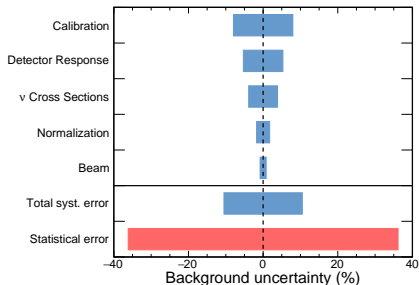

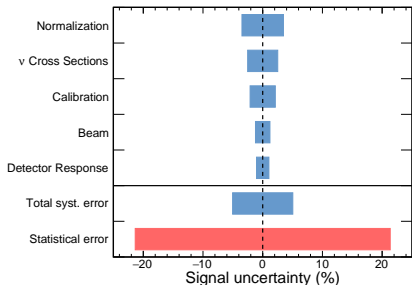

NOvA Preliminary

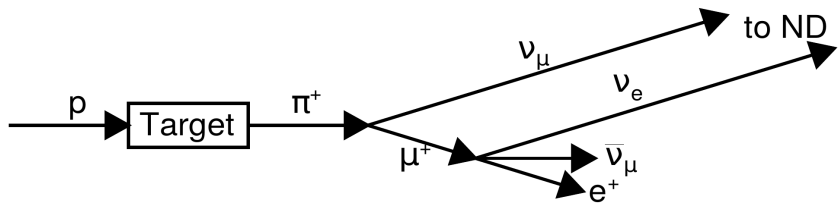

* $\chi^2 = 41.6/17$ driven by fluctuations in the tail

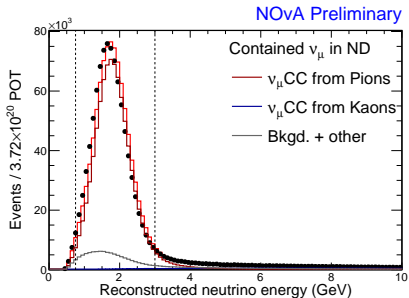

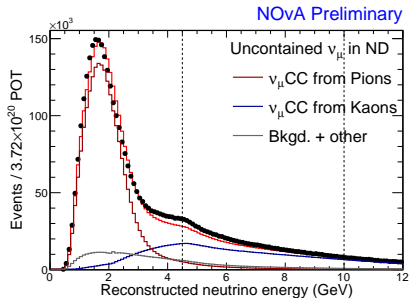

* Restricting the fit upto 2.5 GeV causes minimal change in the result

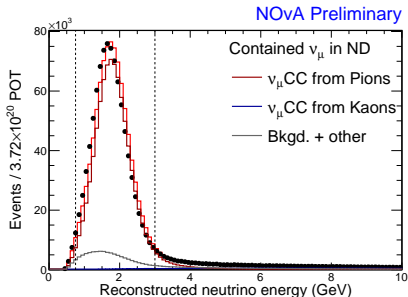

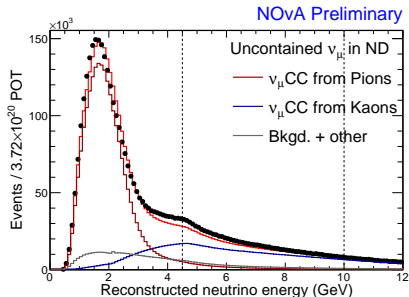

- * Systematic error $\sim 5\%$ on signal and $\sim 10\%$ on background
- * Systematic shifts to the PID \times Energy spectrum included as nuisance parameters in the fit
- * Dominated by statistical error

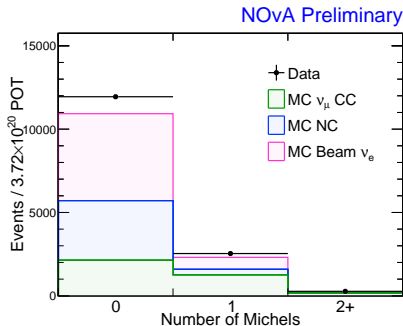

* Beam ν_e 's at NOvA's location mostly arise from muon decay in beamline

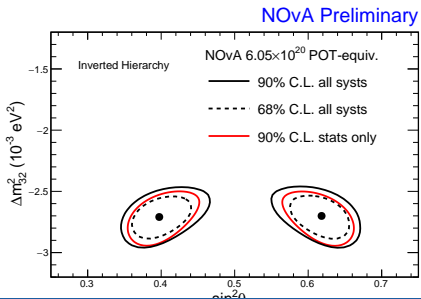

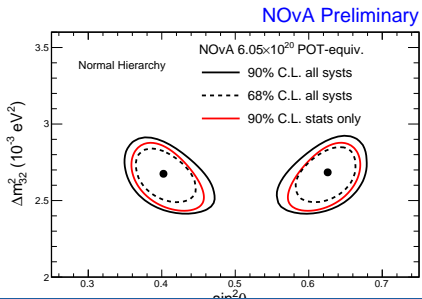

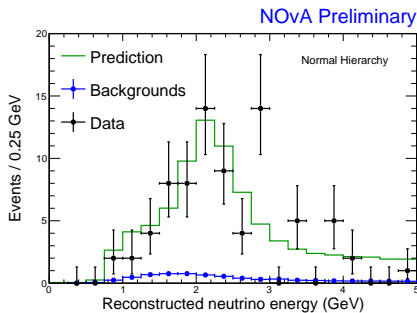

- * Beam ν_e 's at NOvA's location mostly arise from muon decay in beamline
- * At low energy, ν_μ 's and beam ν_e 's come from common pion parents, at higher energy, the parents are Kaons
- * Pion and Kaon yields are derived from the observed low and high energy ν_μ data

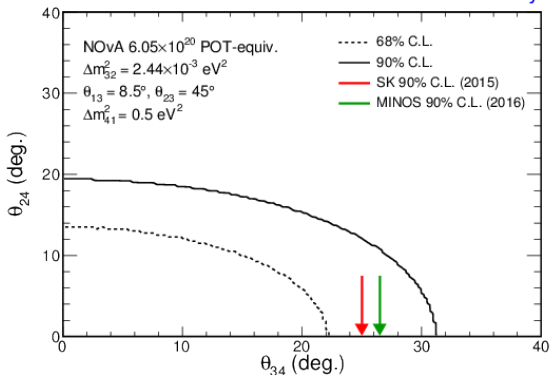

- * Beam ν_e 's at NOvA's location mostly arise from muon decay in beamline
- * At low energy, ν_μ 's and beam ν_e 's come from common pion parents, at higher energy, the parents are Kaons
- * Pion and Kaon yields are derived from the observed low and high energy ν_μ data
- * Infer that Kaon yield is higher by 17% and Pion yield lower by 3%
- * Leads to 1% increase in Beam ν_e background between 1-3 GeV in ND

- * Look for Michels electron associated with interactions selected with ν_e criteria
- * ν_μ CC's should have 1 additional Michel electron than NC and ν_e CC's
- * Fitting the number of Michels distribution suggests an integrated increase of 17.4% in ν_μ CC and 10.4% in NC backgrounds

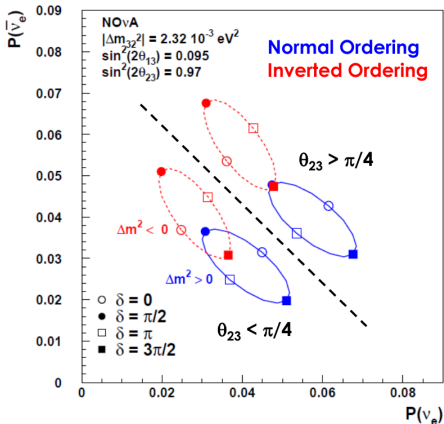

NOvA Preliminary

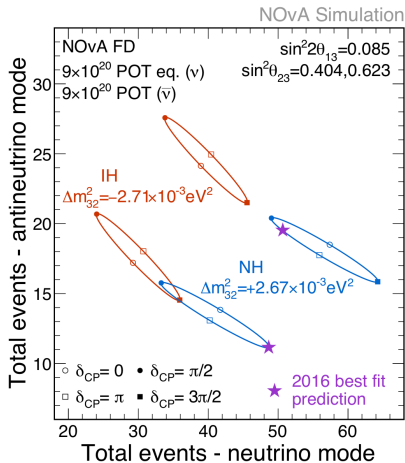

- * Fitting a simple counting experiment
- * $0.05 \text{ eV}^2 < \Delta m_{41}^2 < 0.5 \text{ eV}^2$
- * PDG2016 constraints on 3-flavor oscillation parameters
- * 68% and 90% CL limits for 3+1 hypothesis

Why Anti-neutrinos

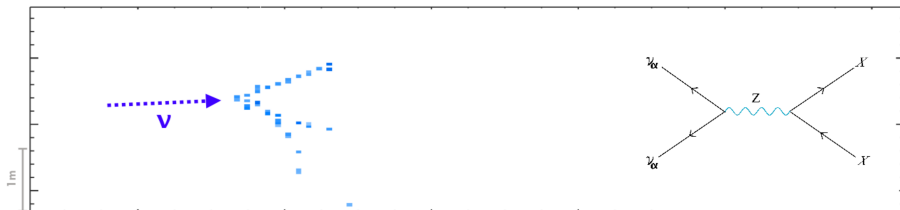

$P(\bar{\nu}_e)$ vs. $P(\nu_e)$ for $\sin^2(2\theta_{23}) = 0.97$

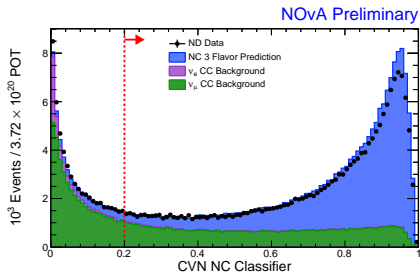

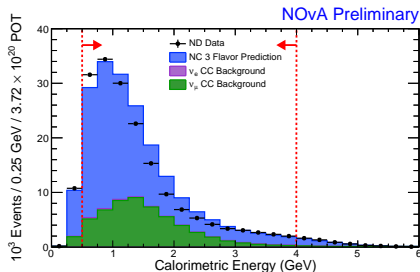

- * Currently there is no information about the vertical axis
- * NuMI switched to anti-neutrino mode in February 2017
- * Plan to run 50% in neutrino and 50% in anti-neutrino mode in 2018
- * Will help resolve some of the degeneracies

- * Currently there is no information about the vertical axis
- * NuMI switched to anti-neutrino mode in February 2017
- * Plan to run 50% in neutrino and 50% in anti-neutrino mode in 2018
- * Will help resolve some of the degeneracies

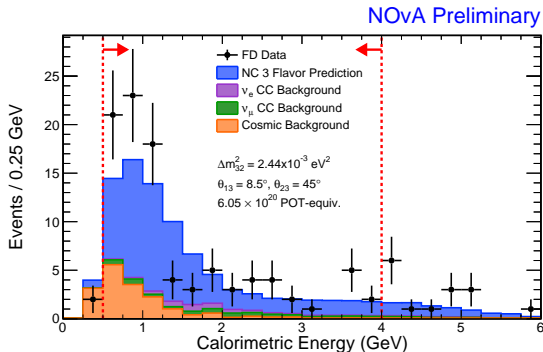

- * Look for reduction in rate of NC, due to oscillation to sterile neutrinos
- * Select NC interactions in ND
- * Extrapolate to FD

- * Using CVN to select NC
- * Shows reasonable agreement between data and MC
- * No NC MEC model available at the time led to large uncertainties

Event Type	Count
Total	83.5
NC	60.6
ν_μ CC	4.6
Beam ν_e CC	3.6
ν_τ CC	0.4
Cosmics	14.3

- * Systematic uncertainties considered are similar to the ν_e appearance and ν_μ disappearance analyses
- * 12.2% systematic error on signal and 15.3% on background
- * Predicted event counts in table computed for maximal mixing

- * Observe 95 events on an expectation of 83
- * The R statistic is $1.19 \pm 0.16(\text{stat.})_{0.14}^{0.10}(\text{syst.})$
- * Measured value of R fully consistent with 3-flavor mixing

$$R = \frac{N_{\text{data}} - \sum N_{\text{pred}}^{\text{bg}}}{N_{\text{pred}}^{\text{NC}}}$$
